Olivier Ejderyan is a lecturer in Human Geography at the Department of Geosciences, University of Fribourg, Switzerland. His research principally investigates the micro politics of river works, with a focus on the consequences of imperatives to participate and to restore rivers, which guide contemporary river management practices.

He has also worked on the relationship between the environmentalisation of agriculture – understood as the integration of environmental norms in farming practices – and the production of new rural subjectivities. He is currently developing new research directions on the politics of the monitoring of permafrost thawing in Switzerland.

Olivier gained his PhD in Geography from the University of Zurich and previously held post-doctoral positions in Sociology at the University of Chiba in Japan and at the National School for Water and Environmental Engineering of Strasbourg in France. He is currently the coordinator of ESPPACE, a research project evaluating the effects of the policy of the Swiss Federal Office for the Environment to subsidize river works projects based on their use of participatory decision-making procedures.
