Poverty Alleviation in the Wake of Typhoon Yolanda: Results of the 2015 Survey of Individuals in Selected Communities¹

Clarinda L. Berja

The 2016 Poverty Alleviation in the Wake of Typhoon Yolanda Survey is a household survey of 800 individuals in selected communities, in Tacloban, Tanauan and Palo in the province of Leyte. It is the second in a series three cross sectional surveys, conducted by the University of Nottingham, United Kingdom in cooperation with the University of Nottingham, Ningbo, China and the University of the Philippines, Diliman. It aims to identify strategies that work in relation to poverty alleviation in post-disaster environments and the conditions necessary for the success and scaling up of these strategies based on the case of relief efforts in selected Yolanda areas. Generating data on urban population risks and vulnerability to disasters as well as resilience towards environmental shocks, are examined in this study.

The survey covers post-Yolanda experiences. Recovery, resilience, community support and capacity-building through training are its main focus. Respondents were asked questions on their experiences, attitudes and perceptions on assistance, relief and relocation. Questions about their access to food, health services and education, livelihood, community support and training on livelihood were also included. The respondents' background characteristics and the household roster were also gathered by survey.

There are two types of data generated by the survey: one is the individual as unit of analysis and the other is the household level data, derived from the household roster form. To generate the individual data, the household head or the spouse of the household head was interviewed. In case when both are not available, any responsible adult who is knowledgeable about the personal details of the members of the household is interviewed. The data generated from this survey serves as baseline data of this study on poverty alleviation two years after selected localities of Tacloban, Tanauan and Palo were

devastated by Yolanda.

The central variable used in the analyses is poverty alleviation. It was determined by asking at self-perceived poverty, access to food, housing, health, education, and livelihood. Respondents were also asked to assess the assistance that they received from within and outside their community.

The questions were ordered in a manner that approximates the natural sequence of experiences in the aftermath of Yolanda experience, in order to help the respondents recall their experiences and to ensure accuracy and consistency of responses.
