

An experimental study considering outcomes for patients with dry skin conditions in relation to an application method for emollients

Investigators: Dr John English, Sister Coleen Gradwell

Queen's Medical Centre, Nottingham

This study aims to discover whether using a 'scoop measure' (5ml teaspoon) to quantify the amount of emollients recommended to patients with dry skin conditions results in increased patient knowledge about the use of emollients and improved concordance with emollient use.

Start date: November 2004

End date: May 2007
