

```
graph TD; Start([Start]) --> LWB[Loosen the wheel bolts]; LWB --> JUW[Jack up wheel]; JUW --> RWB[Remove the wheel bolts]; RWB --> RW[Remove the wheel]; RW --> UBC[Unbolt brake caliper from rotor]; UBC --> RBC[Remove brake caliper from rotor]; RBC --> AGR[Apply grease to rear of replacement brake pad]; AGR --> IBRP[Install and bolt replacement brake pad to caliper]; IBRP --> PCO[Place caliper on rotor]; PCO --> BCR[Bolt caliper to rotor]; BCR --> RW2[Replace the wheel]; RW2 --> RWB2[Replace the wheel bolts]; RWB2 --> LJ[Lower Jack]; LJ --> TWB[Tighten wheel bolts]; TWB --> End([End]); UBC --> UBR[Unbolt and remove brake pad from caliper]; UBR --> RBR[Remove brake rotor]; RBR --> INBR[Install new brake rotor]; INBR --> IBRP; LJ -.-> T1[Task requires technician and wheel jack to perform.]; UBR -.-> T2[Task results in the removal of the brake caliper.]; INBR -.-> T3[Task results in renewal of brake rotor.];
```

The flowchart illustrates the process of replacing a brake rotor and pad. It begins with 'Start' and proceeds through several steps: 'Loosen the wheel bolts', 'Jack up wheel', 'Remove the wheel bolts', 'Remove the wheel', 'Unbolt brake caliper from rotor', 'Remove brake caliper from rotor', 'Apply grease to rear of replacement brake pad', 'Install and bolt replacement brake pad to caliper', 'Place caliper on rotor', 'Bolt caliper to rotor', 'Replace the wheel', 'Replace the wheel bolts', 'Lower Jack', 'Tighten wheel bolts', and finally 'End'. The process also includes a loop for removing the old rotor and installing a new one: 'Unbolt and remove brake pad from caliper', 'Remove brake rotor', and 'Install new brake rotor'. Three annotations provide additional context: 'Task requires technician and wheel jack to perform.' points to the 'Lower Jack' step; 'Task results in the removal of the brake caliper.' points to the 'Remove brake caliper from rotor' step; and 'Task results in renewal of brake rotor.' points to the 'Install new brake rotor' step.

Whilst the design and optimisation of hardware reliability and maintenance policies have been the subject of vast amounts of research, the design and optimisation of the maintenance service design has received little attention. This research project aims to develop methods for modelling maintenance from a service design perspective that considers all the constraints and performance objectives discussed above and integrate them within a software tool. This tool will be designed to enable maintenance service designs to be developed, documented, explored, analysed and optimised.

Modelling complex maintenance services can be divided into two parts:

1. The representation of the maintenance service design.
2. The execution of the maintenance service design on a hardware system or set of systems to produce performance predictions.

A modelling language, defined as a set of one or more syntaxes (graphical or textual) used to express information and knowledge, is required for the representation. A research problem in this area is finding a solution that strikes a suitable balance between generality, such that maintenance service designs for a wide range of systems can be represented, and specificity, such that the maintenance design of a particular system can be represented with sufficient detail to meet the modelling objectives. Another is finding ways to perform constraints analysis and develop computer tools that can assist with the development of new maintenance service designs (e.g. through a graphical user interface).

For the execution of maintenance on a system or systems, a methodology and computer code that can analyse any maintenance design represented using the modelling language is needed. The discrete event simulation technique is ideal for this purpose due to the inherent complexity of the processes to be modelled and the variety of detailed output data that is sought. Research problems include optimising the computational efficiency and finding suitable metrics for measuring service performance.

A modelling language and computer code for model analysis (written in C#) are currently under development. Once complete, they will be integrated with an existing tool that has been developed to model hardware reliability and maintenance strategy. The figure below shows the iterative design workflow that the research aims to enable:
