

HOW CAN WE DELIVER A HEALTHY, SUSTAINABLE, CARBON-NEUTRAL UK FOOD SUPPLY?

FUTURE FOOD RESEARCH BEACON, UNIVERSITY OF NOTTINGHAM

By 2050 we will have welcomed another 2 billion people to our planet, yet climate change is expected to cut global food production by up to 34% of current levels. The UK is not immune from this challenge.

Delivering a healthy, sustainable, and carbon-neutral food supply to the UK population will require an integrated approach across production, consumption, and retail.

The coronavirus pandemic exposed the fragility and unsustainability of our food supply. Extreme weather events like heatwaves and flooding could also impact international food production and supply chains, resulting in increased food prices for UK consumers.
